

WAP-EN1200C AC1200 Ceiling Mount Access Point User Manual

Version 1.1.0, January 2017

FCC Compliance

This equipment has been tested and found to comply with the limits for a Class B Digital Device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instruction, may cause harmful interference to radio communication. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna
- Increase the separation between the equipment and receiver
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected
- Consult the dealer or an experienced radio/TV technician for help.

The changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

To comply with the FCC RF exposure compliance requirements, this device and its antenna must not be co-located or operating to conjunction with any other antenna or transmitter. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

Overview

Your access point can function in three different modes.

The default mode for your access point is “AP Mode”.

AP Mode is a regular access point for your network.

AP Controller Mode acts as a designated “Master” for an array of “Slave” access points. (Group of linked access points)

Managed AP Mode acts like a “Slave” access point in an access point array. (Controlled by the AP Controller “Master”)

The user interface will change depending on which mode is selected.

This manual will cover the AP Mode functions.

I. *Product Information*

I-1. Package Contents

2

3

4

5

1. Access Point

4. Quick Installation Guide

2. Ceiling Mount Bracket

5. Power Adapter

3. Drop Ceiling Mounting Kit

I-2. System Requirements

- Existing cable/DSL modem & router.
- Computer with web browser for access point configuration.

I-3. Hardware Overview

I-4. LED Status

LED Color	LED Status	Description
Purple	On	The access point is starting up.
Blue	On	The access point is on.
Amber	Flashing	Error.
Off	Off	The access point is off.

I-5. Reset

If you experience problems with your access point, you can reset the device back to its factory settings. This will reset all settings back to default.

1. Press and hold the reset button on the access point for at least 10 seconds. Then release the button.

You may need to use a paperclip or pencil to push the reset button.

2. Wait for the access point to restart. The access point is ready for setup when the LED is **Blue**.

I-6. Safety Information

In order to ensure the safe operation of the device and its users, please read and act in accordance with the following safety instructions.

1. The access point is designed for indoor use only; do not place the access point outdoors.
2. Do not place the access point in or near hot/humid places, such as a kitchen or bathroom.
3. Do not pull any connected cable with force; carefully disconnect it from the access point.
4. Handle the access point with care. Accidental damage will void the warranty of the access point.
5. The device contains small parts which are a danger to small children under 3 years old. Please keep the access point out of reach of children.
6. Do not place the access point on paper, cloth, or other flammable materials. The access point may become hot during use.
7. There are no user-serviceable parts inside the access point. If you experience problems with the access point, please contact Comtrend Customer Service for assistance.
8. The access point is an electrical device and as such, if it becomes wet for any reason, do not attempt to touch it without switching the power supply off. Contact an experienced electrical technician for further help.
9. If you smell burning or see smoke coming from the access point or power adapter, then disconnect the access point and power adapter immediately, as far as it is safely possible to do so. Contact Comtrend Customer Service for assistance.

II. Quick Setup

Your access point is preconfigured in a secured setup and ready for use right out of the box. The following instructions will help you install your access point and customize your settings. Follow the instructions in the chapters below:

II-1. Initial Setup

1. Connect the access point to a computer via Ethernet cable.
2. Connect the power adapter to the access point's 12V DC port and plug the power adapter into a power supply.

3. Please wait a moment for the access point to start up. The access point is ready when the LED is **Blue**.
4. Set your computer's IP address to **192.168.2.x** where **x** is a number in the range **3 – 100**. If you are unsure how to do this, please refer to Appendix **V-1. Configuring your IP address** for more information.

DHCP is enabled on the access by default. If no DHCP Service is found, the access point will default to IP address 192.168.2.1.

5. Enter the access point's default IP address **192.168.2.1** into the URL bar of a web browser.

6. You will be prompted for a username and password. Enter the default username “admin” and the default password “admin”.

7. You will arrive at the “System Information” screen shown below.

The screenshot shows the COMTREND WAP-EN1200C web interface. The top navigation bar includes "Home", "Logout", and a language dropdown set to "Global (English)". Below this is a secondary navigation bar with tabs: "Information", "Network Settings", "Wireless Settings", "Management", "Advanced", and "Operation Mode". The "Information" tab is active, and a left sidebar shows a menu with "System Information" selected, along with "Wireless Clients", "Wireless Monitor", and "Log". The main content area is titled "System Information" and contains a table of system details.

System	
Model	WAP-EN1200C
Product Name	1200C-10
Uptime	0 day 00:08:32
System Time	2016/08/03 12:38:30
Boot from	Internal memory
Firmware Version	1.0.1
MAC Address	74:DA:38:40:E0:FA
Management VLAN ID	1
IP Address	192.168.0.10
Default Gateway	192.168.0.1
DNS	4.2.2.2 4.2.2.1
DHCP Server	---

8. Next, follow the instructions below in **II-2. Basic Settings** to configure the access point’s basic settings.

For more advanced configurations, refer to IV. Browser Based Configuration Interface.

II-2. Basic Settings

The instructions below will help you to configure the following basic settings of the access point:

- **LAN IP Address**
- **2.4GHz & 5GHz SSID & Security**
- **Administrator Name & Password**
- **Time & Date**

It is recommended you configure these settings before using the access point.

1. To change the access point's LAN IP address, go to **"Network Settings" > "LAN-side IP Address"** and you will see the screen below.

The screenshot shows the COMTREND WAP-EN1200C web interface. The top navigation bar includes 'Home | Logout | Global (English)'. The main menu has tabs for 'Information', 'Network Settings', 'Wireless Settings', 'Management', 'Advanced', and 'Operation Mode'. The 'Network Settings' tab is active, and the left sidebar shows 'LAN-side IP Address' selected. The main content area is titled 'LAN-side IP Address' and contains a table with the following settings:

LAN-side IP Address	
IP Address Assignment	DHCP Client
IP Address	192.168.2.1
Subnet Mask	255.255.255.0
Default Gateway	From DHCP 192.168.0.1
Primary DNS Address	From DHCP 4.2.2.2
Secondary DNS Address	From DHCP 4.2.2.1

An 'Apply' button is located at the bottom right of the configuration area.

2. Enter the IP address settings you wish to use for your access point. You can use a dynamic (DHCP) or static IP address, depending on your network environment. Click "Apply" to save the changes and wait a few moments for the access point to reload.

When you change your access point's IP address, you need to use the new IP address to access the browser based configuration interface instead of the default IP 192.168.2.1.

3. To change the SSID of your access point's 2.4GHz wireless network(s), go to **"Wireless Setting" > "2.4GHz 11bgn" > "Basic"**. Enter the new SSID for your 2.4GHz wireless network in the "SSID1" field and click "Apply".

To utilize multiple 2.4GHz SSIDs, open the drop down menu labelled "Enable SSID number" and select how many SSIDs you require. Then enter a new SSID in the corresponding numbered fields below, before clicking "Apply".

Time Zone	
Time Zone	(GMT) Greenwich Mean Time: Dublin, Edinburgh, Lisbon, London ▼

- Set the correct time and time zone for your access point using the drop down menus. The access point also supports NTP (Network Time Protocol) so alternatively you can enter the host name or IP address of a time server. Click “Apply” when you are finished.

You can use the “Acquire Current Time from your PC” button if you wish to set the access point to the same time as your PC.

- The basic settings of your access point are now configured. Refer to **III. Hardware Installation** for guidance on connecting your access point to a router or PoE switch.

III. Hardware Installation

III-1. Connecting the access point to a router or PoE switch

1. If you need to, remove the cap from the underside of the access point. This creates extra space for your cables to pass through.

2. Connect a router or PoE switch to the access point's **LAN** port using an Ethernet cable.

3. If you are using a router, then connect the power adapter to the access point's 12V DC port and plug the power adapter into a power supply.

4. If you are using a PoE (Power over Ethernet) switch then it is not necessary to use the included power adapter, the access point will be powered by the PoE switch.

III-2. Mounting the access point to a ceiling

To mount the access point to a ceiling, follow the instructions below and refer to diagram **A & B**.

For Wooden Ceilings (refer to diagram A):

- 1.** Place the ceiling mount bracket to a ceiling in your desired location and insert screw **iii** through hole **i** (x 2) and tighten to fix the bracket in place.
- 2.** When the ceiling bracket is in place, insert screw **iv** into hole **v** (x 2) on the access point.
- 3.** Fix the access point to the ceiling bracket by inserting the attached screws **iv** into hole **vi** and twisting the access point.
- 4.** Lock the access point firmly into place when by twisting it to align screws **iv** with the grooves in the ceiling mount.

For Other Ceilings (refer to diagram B):

- 1.** Place the ceiling mount bracket to a ceiling in your desired location and Insert screw **ii** through hole **i** (x 2) and tighten to fix the bracket in place, as shown in **A**.
- 2.** Insert screw **iii** through hole **i** and into the rear of screw **ii** and tighten to provide additional strength.
- 3.** When the ceiling bracket is in place, insert screw **iv** into hole **v** (x 2) on the access point.
- 4.** Fix the access point to the ceiling bracket by inserting the attached screws **iv** into hole **vi** and twisting the access point.
- 5.** Lock the access point firmly into place by twisting it to align screws **iv** with the grooves in the ceiling mount.

A

B

III-3. T-Rail Mount

To mount the access point to a T-Rail, follow the instructions below and refer to diagram **C**, **D** & **E**.

1. Select the correct size T-Rail bracket from the two sizes which are included in the package contents.
2. Attach the T-Rail bracket **i** to hole **ii** using screw **iii** (x 2) as shown in **C**.

If you need more space between the access point and the T-Rail, then additionally use bracket **iv** between bracket **i** and hole **ii** (x 2), and use the longer screws (x 2) included in the package contents.

3. Clip the access point onto your T-Rail using the now attached T-Rail bracket.

D

E

IV. Browser Based Configuration Interface

The browser-based configuration interface enables you to configure the access point's advanced features. The device features a range of advanced functions such as MAC filtering, MAC RADIUS authentication, VLAN configurations, up to 32 SSIDs and many more. To access the browser based configuration interface:

1. Connect a computer to your access point using an Ethernet cable.
2. Enter your access point's IP address in the URL bar of a web browser. If no DHCP Services is discovered, the access point's default IP address is **192.168.2.1**.
3. You will be prompted for a username and password. The default username is "admin" and the default password is "admin", though it was recommended that you change the password during setup (see **II-2. Basic Settings**).

If you cannot remember your password, reset the access point back to its factory default settings. Refer to I-5. Reset

4. You will arrive at the "System Information" screen shown below.

The screenshot shows the Comtrend WAP-EN1200C web interface. The top navigation bar includes links for Home, Logout, and Global (English). The main menu on the left lists Information, System Information, Wireless Clients, Wireless Monitor, and Log. The System Information page displays a table of system details.

IV-2. Network Settings

 *Screenshots displayed are examples. The information shown on your screen will vary depending on your configuration.*

IV-2-1. LAN-Side IP Address

> LAN-side IP Address

The “LAN-side IP address” page allows you to configure your access point on your Local Area Network (LAN). You can enable the access point to dynamically receive an IP address from your router’s DHCP server or you can specify a static IP address for your access point, as well as configure DNS servers.

 *The access point’s default IP address is 192.168.2.1.*

LAN-side IP Address

IP Address Assignment	DHCP Client	
IP Address	192.168.2.1	
Subnet Mask	255.255.255.0	
Default Gateway	From DHCP	

DNS Servers

Primary Address	From DHCP	
Secondary Address	From DHCP	

LAN-side IP Address	
IP Address Assignment	Select “DHCP Client” for your access point to be assigned a dynamic IP address from your router’s DHCP server, or select “Static IP” to manually specify a static/fixed IP address for your access point (below).
IP Address	Specify the IP address here. This IP address will be assigned to your access point and will

	replace the default IP address.
Subnet Mask	Specify a subnet mask. The default value is 255.255.255.0
Default Gateway	For DHCP users, select “From DHCP” to get default gateway from your DHCP server or “User-Defined” to enter a gateway manually. For static IP users, the default value is blank.

DHCP users can select to get DNS servers’ IP address from DHCP or manually enter a value. For static IP users, the default value is blank.

Primary Address	DHCP users can select “From DHCP” to get primary DNS server’s IP address from DHCP or “User-Defined” to manually enter a value. For static IP users, the default value is blank.
Secondary Address	Users can manually enter a value when DNS server’s primary address is set to “User-Defined”.

IV-2-2. LAN Port

> LAN Port

The “LAN Port” page allows you to configure the settings for your access point’s wired LAN (Ethernet) port.

Wired LAN Port Settings				
Wired LAN Port	Enable	Speed & Duplex	Flow Control	802.3az
Wired Port (#1)	Enabled ▼	Auto ▼	Enabled ▼	Enabled ▼

Wired LAN Port	Identifies LAN port 1.
Enable	Enable/disable LAN port.
Speed & Duplex	Select a speed & duplex type for LAN port, or use the “Auto” value. LAN ports can operate up to 1000Mbps and full-duplex enables simultaneous data packets transfer/receive.
Flow Control	Enable/disable flow control. Flow control can pause new session request until current data processing is complete, in order to avoid device overloads under heavy traffic.
802.3az	Enable/disable 802.3az. 802.3az is an Energy Efficient Ethernet feature which disables unused interfaces to reduce power usage.

IV-2-3. VLAN

> VLAN

The “VLAN” (Virtual Local Area Network) enables you to configure VLAN settings. A VLAN is a local area network which maps workstations virtually instead of physically and allows you to group together or isolate users from each other. VLAN IDs 1 – 4094 are supported.

VLAN IDs in the range 1 – 4094 are supported.

VLAN Interface

Wired LAN Port	VLAN Mode	VLAN ID
Wired Port (#1)	Untagged Port	1

Wireless 2.4GHz	VLAN Mode	VLAN ID
SSID [CAP1200-CCDD10_G]	Untagged Port	1

Wireless 5GHz	VLAN Mode	VLAN ID
SSID [CAP1200-CCDD10_A]	Untagged Port	1

Management VLAN

VLAN ID	1
---------	---

VLAN Interface	
Wired LAN Port/Wireless	Identifies LAN port 1 and wireless SSIDs (2.4GHz or 5GHz).
VLAN Mode	Select “Tagged Port” or “Untagged Port” for LAN interface.
VLAN ID	Set a VLAN ID for specified interface, if “Untagged Port” is selected.

Management VLAN	
VLAN ID	Specify the VLAN ID of the management VLAN. Only the hosts belonging to the same VLAN can manage the device.

IV-3. Wireless Settings

Screenshots displayed are examples. The information shown on your screen will vary depending on your configuration.

IV-3-1. 2.4GHz 11bgn

The “2.4GHz 11bgn” menu allows you to view and configure information for your access point’s 2.4GHz wireless network across four categories: Basic, Advanced, Security and WDS.

IV-3-1-1. Basic

> Basic

The “Basic” screen displays basic settings for your access point’s 2.4GHz Wi-Fi network (s).

2.4GHz Basic Settings	
Wireless	☒ Enable ☐ Disable
Band	11b/g/n ▼
Enable SSID number	1 ▼
SSID1	CAP1200-CCDD10_G VLAN ID 1
Auto Channel	☒ Enable ☐ Disable
Auto Channel Range	Ch 1 - 11 ▼
Auto Channel Interval	One day ▼ ☐ Change channel even if clients are connected
Channel Bandwidth	Auto ▼
BSS BasicRateSet	1,2,5.5,11 Mbps ▼

Auto Channel	☐ Enable ☒ Disable
Channel	Ch 11, 2462MHz ▼
Channel Bandwidth	Auto, +Ch 7 ▼
BSS BasicRateSet	1,2,5.5,11 Mbps ▼

Wireless	Enable or disable the access point's 2.4GHz wireless radio. When disabled, no 2.4GHz SSIDs will be active.
Band	Select the wireless standard used for the access point. Combinations of 802.11b, 802.11g & 802.11n can be selected.
Enable SSID Number	Select how many SSIDs to enable for the 2.4GHz frequency from the drop down menu. A maximum of 16 can be enabled.
SSID#	Enter the SSID name for the specified SSID (up to 16). The SSID can consist of any combination of up to 32 alphanumeric characters.
VLAN ID	Specify a VLAN ID for each SSID.
Auto Channel	Enable/disable auto channel selection. Auto channel selection will automatically set the wireless channel for the access point's 2.4GHz frequency based on availability and potential interference. When disabled, select a channel manually as shown in the next table.
Auto Channel Range	Select a range from which the auto channel setting (above) will choose a channel.
Auto Channel Interval	Specify a frequency for how often the auto channel setting will check/reassign the wireless channel. Check/uncheck the "Change channel even if clients are connected" box according to your preference.
Channel Bandwidth	Set the channel bandwidth: 20MHz (lower performance but less interference), 40MHz (higher performance but potentially higher interference) or Auto (automatically select based on interference level).
BSS Basic Rate Set	Set a Basic Service Set (BSS) rate: this is a series of rates to control communication frames for wireless clients.

When auto channel is disabled, select a wireless channel manually:

Channel	Select a wireless channel from 1 – 11 (1-13).
Channel Bandwidth	Set the channel bandwidth: 20MHz (lower performance but less interference), 40MHz (higher performance but potentially higher interference) or Auto (automatically select based on interference level).
BSS Basic Rate Set	Set a Basic Service Set (BSS) rate: this is a series of rates to control communication frames for wireless clients.

IV-3-1-2. Advanced

> Advanced

These settings are for experienced users only. Please do not change any of the values on this page unless you are already familiar with these functions.

Changing these settings can adversely affect the performance of your access point.

2.4GHz Advanced Settings	
Contention Slot	Short ▼
Preamble Type	Short ▼
Guard Interval	Short GI ▼
802.11g Protection	☒ Enable ☐ Disable
802.11n Protection	☒ Enable ☐ Disable
DTIM Period	1 (1-255)
RTS Threshold	2347 (1-2347)
Fragment Threshold	2346 (256-2346)
Multicast Rate	Auto ▼
Tx Power	100% ▼
Beacon Interval	100 (40-1000 ms)
Station idle timeout	60 (30-65535 seconds)

Contention Slot	Select “Short” or “Long” – this value is used for contention windows in WMM (see IV-3-6. WMM).
Preamble Type	Set the wireless radio preamble type. The preamble type in 802.11 based wireless communication defines the length of the CRC (Cyclic Redundancy Check) block for communication between the access point and roaming wireless adapters. The default value is “Short Preamble”.
Guard Interval	Set the guard interval. A shorter interval can improve performance.

802.11g Protection	Enable/disable 802.11g protection, which increases reliability but reduces bandwidth (clients will send Request to Send (RTS) to access point, and access point will broadcast Clear to Send (CTS), before a packet is sent from client.)
802.11n Protection	Enable/disable 802.11n protection, which increases reliability but reduces bandwidth (clients will send Request to Send (RTS) to access point, and access point will broadcast Clear to Send (CTS), before a packet is sent from client.)
DTIM Period	Set the DTIM (delivery traffic indication message) period value of the wireless radio. The default value is 1.
RTS Threshold	Set the RTS threshold of the wireless radio. The default value is 2347.
Fragment Threshold	Set the fragment threshold of the wireless radio. The default value is 2346.
Multicast Rate	Set the transfer rate for multicast packets or use the "Auto" setting.
Tx Power	Set the power output of the wireless radio. You may not require 100% output power. Setting a lower power output can enhance security since potentially malicious/unknown users in distant areas will not be able to access your signal.
Beacon Interval	Set the beacon interval of the wireless radio. The default value is 100.
Station idle timeout	Set the interval for keep alive messages from the access point to a wireless client to verify if the station is still alive/active.

IV-3-1-3. Security

> Security

The access point provides various security options (wireless data encryption). When data is encrypted, information transmitted wirelessly cannot be read by anyone who does not know the correct encryption key.

It's essential to configure wireless security in order to prevent unauthorised access to your network.

Select hard-to-guess passwords which include combinations of numbers, letters and symbols, and change your password regularly.

2.4GHz Wireless Security Settings	
SSID	CAP1200-CCDD10_G ▼
Broadcast SSID	Enable ▼
Wireless Client Isolation	Disable ▼
Load Balancing	50 /50
Authentication Method	No Authentication ▼
Additional Authentication	No additional authentication ▼

SSID Selection	Select which SSID to configure security settings for.
Broadcast SSID	Enable or disable SSID broadcast. When enabled, the SSID will be visible to clients as an available Wi-Fi network. When disabled, the SSID will not be visible as an available Wi-Fi network to clients – clients must manually enter the SSID in order to connect. A hidden (disabled) SSID is typically more secure than a visible (enabled) SSID.
Wireless Client Isolation	Enable or disable wireless client isolation. Wireless client isolation prevents clients connected to the access point from communicating with each other and improves security. Typically, this function is useful for corporate environments or public hot spots and can prevent brute force attacks on clients' usernames and passwords.
Load Balancing	Load balancing limits the number of wireless clients connected to an SSID. Set a load balancing value (maximum 50).
Authentication Method	Select an authentication method from the drop down menu and refer to the information below appropriate for your method.
Additional Authentication	Select an additional authentication method from the drop down menu and refer to the information below (IV-3-1-3-6.) appropriate for your method.

IV-3-1-3-1. No Authentication

Authentication is disabled and no password/key is required to connect to the access point.

Disabling wireless authentication is not recommended. When disabled, anybody within range can connect to your device's SSID.

IV-3-1-3-2. WEP

WEP (Wired Equivalent Privacy) is a basic encryption type. For a higher level of security consider using WPA encryption.

Key Length	Select 64-bit or 128-bit. 128-bit is more secure than 64-bit and is recommended.
Key Type	Choose from “ASCII” (any alphanumerical character 0-9, a-z and A-Z) or “Hex” (any characters from 0-9, a-f and A-F).
Default Key	Select which encryption key (1 – 4 below) is the default key. For security purposes, you can set up to four keys (below) and change which is the default key.
Encryption Key 1 – 4	Enter your encryption key/password according to the format you selected above.

IV-3-1-3-3. IEEE802.1x/EAP

Key Length	Select 64-bit or 128-bit. 128-bit is more secure than 64-bit and is recommended.
-------------------	--

IV-3-1-3-4. WPA-PSK

WPA-PSK is a secure wireless encryption type with strong data protection and user authentication, utilizing 128-bit encryption keys.

WPA Type	Select from WPA/WPA2 Mixed Mode-PSK, WPA2 or WPA only. WPA2 is safer than WPA only, but not supported by all wireless clients. Please make sure your wireless client supports your selection.
Encryption	Select “TKIP/AES Mixed Mode” or “AES” encryption type.
Key Renewal Interval	Specify a frequency for key renewal in minutes.
Pre-Shared Key	Choose from “Passphrase” (8 – 63

Type	alphanumeric characters) or “Hex” (up to 64 characters from 0-9, a-f and A-F).
Pre-Shared Key	Please enter a security key/password according to the format you selected above.

IV-3-1-3-5. WPA-EAP

WPA Type	Select from WPA/WPA2 Mixed Mode-EAP, WPA2-EAP or WPA-EAP.
Encryption	Select “TKIP/AES Mixed Mode” or “AES” encryption type.
Key Renewal Interval	Specify a frequency for key renewal in minutes.

WPA-EAP must be disabled to use MAC-RADIUS authentication.

IV-3-1-3-6. Additional Authentication

Additional wireless authentication methods can also be used:

MAC Address Filter

Restrict wireless clients access based on MAC address specified in the MAC filter table.

See IV-3-5.MAC Filter to configure MAC filtering.

MAC Filter & MAC-RADIUS Authentication

Restrict wireless clients access using both of the above MAC filtering & RADIUS authentication methods.

MAC-RADIUS Authentication

Restrict wireless clients access based on MAC address via a RADIUS server, or password authentication via a RADIUS server.

See IV-3-4.RADIUS to configure RADIUS servers.

WPS must be disabled to use MAC-RADIUS authentication. See IV-3-3. for WPS settings.

MAC RADIUS Password

☒ Use MAC address

☐ Use the following password

**MAC RADIUS
Password**

Select whether to use MAC address or password authentication via RADIUS server. If you select “Use the following password”, enter the password in the field below. The password should match the “Shared Secret” used in **IV-3-4. RADIUS**.

IV-3-1-4. WDS

> WDS Wireless Distribution System (WDS) can bridge/repeat access points together in an extended network. WDS settings can be configured as shown below.

When using WDS, configure the IP address of each access point to be in the same subnet and ensure there is only one active DHCP server among connected access points, preferably on the WAN side.

WDS must be configured on each access point, using correct MAC addresses. All access points should use the same wireless channel and encryption method.

2.4GHz	
WDS Functionality	Disabled
Local MAC Address	Disabled
	WDS with AP
	Dedicated WDS

WDS Peer Settings	
WDS #1	MAC Address
WDS #2	MAC Address
WDS #3	MAC Address
WDS #4	MAC Address

WDS VLAN	
VLAN Mode	Untagged Port (Enter at least one MAC address.)
VLAN ID	1

WDS Encryption method	
Encryption	None (Enter at least one MAC address.)

2.4GHz	
WDS Functionality	Select “WDS with AP” to use WDS with access point or “Dedicated WDS” to use WDS and also block communication with regular wireless clients. When WDS is used, each access point should be configured with corresponding MAC addresses, wireless channel and wireless encryption method.
Local MAC Address	Displays the MAC address of your access point.

WDS Peer Settings	
WDS #	Enter the MAC address for up to four other WDS devices you wish to connect.

WDS VLAN	
VLAN Mode	Specify the WDS VLAN mode to “Untagged Port” or “Tagged Port”.
VLAN ID	Specify the WDS VLAN ID when “Untagged Port” is selected above.

WDS Encryption method	
Encryption	Select whether to use “None” or “AES” encryption and enter a pre-shared key for AES consisting of 8-63 alphanumeric characters.

IV-3-1-5. Guest Network

The “Guest Network” page allows you to configure a guest network that will have a Layer-3 IP Filter applied to all traffic passing through the specific SSID.

When using a Guest Network, Traffic Shaping and IP Filter settings will be applied to all traffic passing through the Guest Network SSID.

Guest Network	
2.4GHz SSID	Comtrend-2.4g ▼

Filtering Settings	Select “Allow” or “Deny” to apply IP Filtering to the traffic on the Guest Network. Provide the IP and Subnet Mask you want to apply as a filter. Up to 3 IP Filters are supported.

IV-3-2. 5GHz 11ac 11an

> 5GHz 11ac 11an

The “5GHz 11ac 11an” menu allows you to view and configure information for your access point’s 5GHz wireless network across four categories: Basic, Advanced, Security and WDS.

IV-3-2-1. Basic

> Basic

The “Basic” screen displays basic settings for your access point’s 5GHz Wi-Fi network (s).

5GHz Basic Settings	
Wireless	☒ Enable ☐ Disable
Band	11a/n/ac
Enable SSID number	1
SSID1	CAP1200-CCDD10_A VLAN ID 1
Auto Channel	☒ Enable ☐ Disable
Auto Channel Range	Band 1
Auto Channel Interval	One day ☐ Change channel even if clients are connected
Channel Bandwidth	Auto 80/40/20 MHz
BSS BasicRateSet	6,12,24 Mbps

Auto Channel	☐ Enable ☒ Disable
Channel	Ch 36, 5.18GHz
Channel Bandwidth	Auto 80/40/20 MHz
BSS BasicRateSet	6,12,24 Mbps

Wireless	Enable or disable the access point’s 5GHz wireless radio. When disabled, no 5GHz SSIDs
----------	--

	will be active.
Band	Select the wireless standard used for the access point. Combinations of 802.11a, 802.11n & 802.11ac can be selected.
Enable SSID Number	Select how many SSIDs to enable for the 5GHz frequency from the drop down menu. A maximum of 16 can be enabled.
SSID#	Enter the SSID name for the specified SSID (up to 16). The SSID can consist of any combination of up to 32 alphanumeric characters.
VLAN ID	Specify a VLAN ID for each SSID.
Auto Channel	Enable/disable auto channel selection. Auto channel selection will automatically set the wireless channel for the access point's 5GHz frequency based on availability and potential interference. When disabled, select a channel manually as shown in the next table.
Auto Channel Range	Select a range from which the auto channel setting (above) will choose a channel.
Auto Channel Interval	Specify a frequency for how often the auto channel setting will check/reassign the wireless channel. Check/uncheck the "Change channel even if clients are connected" box according to your preference.
Channel Bandwidth	Set the channel bandwidth: 20MHz (lower performance but less interference), Auto 40/20MHz or Auto 80/40/20MHz (automatically select based on interference level).
BSS Basic Rate Set	Set a Basic Service Set (BSS) rate: this is a series of rates to control communication frames for wireless clients.

When auto channel is disabled, select a wireless channel manually:

Channel	Select a wireless channel.
Channel Bandwidth	Set the channel bandwidth: 20MHz (lower performance but less interference), Auto 40/20MHz or Auto 80/40/20MHz

	(automatically select based on interference level).
BSS Basic Rate Set	Set a Basic Service Set (BSS) rate: this is a series of rates to control communication frames for wireless clients.

IV-3-2-2. Advanced

> Advanced

These settings are for experienced users only. Please do not change any of the values on this page unless you are already familiar with these functions.

Changing these settings can adversely affect the performance of your access point.

5GHz Advanced Settings	
Guard Interval	Short GI ▾
802.11n Protection	☒ Enable ☐ Disable
DTIM Period	1 (1-255)
RTS Threshold	2347 (1-2347)
Fragment Threshold	2346 (256-2346)
Multicast Rate	Auto ▾
Tx Power	100% ▾
Beacon Interval	100 (40-1000 ms)
Station idle timeout	60 (30-65535 seconds)

Guard Interval	Set the guard interval. A shorter interval can improve performance.
802.11n Protection	Enable/disable 802.11n protection, which increases reliability but reduces bandwidth (clients will send Request to Send (RTS) to access point, and access point will broadcast Clear to Send (CTS), before a packet is sent from client.)
DTIM Period	Set the DTIM (delivery traffic indication message) period value of the wireless radio. The default value is 1.
RTS Threshold	Set the RTS threshold of the wireless radio. The default value is 2347.
Fragment Threshold	Set the fragment threshold of the wireless radio. The default value is 2346.
Multicast Rate	Set the transfer rate for multicast packets or use the “Auto” setting.

Tx Power	Set the power output of the wireless radio. You may not require 100% output power. Setting a lower power output can enhance security since potentially malicious/unknown users in distant areas will not be able to access your signal.
Beacon Interval	Set the beacon interval of the wireless radio. The default value is 100.
Station idle timeout	Set the interval for keep alive messages from the access point to a wireless client to verify if the station is still alive/active.

IV-3-2-3. Security

> Security

The access point provides various security options (wireless data encryption). When data is encrypted, information transmitted wirelessly cannot be read by anyone who does not know the correct encryption key.

It's essential to configure wireless security in order to prevent unauthorised access to your network.

Select hard-to-guess passwords which include combinations of numbers, letters and symbols, and change your password regularly.

5GHz Wireless Security Settings	
SSID	CAP1200-CCDD10_A ▾
Broadcast SSID	Enable ▾
Wireless Client Isolation	Disable ▾
Load Balancing	50 /50
Authentication Method	No Authentication ▾
Additional Authentication	No additional authentication ▾

SSID Selection	Select which SSID to configure security settings for.
Broadcast SSID	Enable or disable SSID broadcast. When enabled, the SSID will be visible to clients as an available Wi-Fi network. When disabled, the SSID will not be visible as an available Wi-Fi network to clients – clients must manually enter the SSID in order to connect. A hidden (disabled) SSID is typically more secure than a visible (enabled) SSID.

Wireless Client Isolation	Enable or disable wireless client isolation. Wireless client isolation prevents clients connected to the access point from communicating with each other and improves security. Typically, this function is useful for corporate environments or public hot spots and can prevent brute force attacks on clients' usernames and passwords.
Load Balancing	Load balancing limits the number of wireless clients connected to an SSID. Set a load balancing value (maximum 50).
Authentication Method	Select an authentication method from the drop down menu and refer to the information below appropriate for your method.
Additional Authentication	Select an additional authentication method from the drop down menu and refer to the information below appropriate for your method.

Please refer back to **IV-3-1-3. Security** for more information on authentication and additional authentication types.

IV-3-2-4. WDS

> WDS

Wireless Distribution System (WDS) can bridge/repeat access points together in an extended network. WDS settings can be

configured as shown below.

When using WDS, configure the IP address of each access point to be in the same subnet and ensure there is only one active DHCP server among connected access points, preferably on the WAN side.

WDS must be configured on each access point, using correct MAC addresses. All access points should use the same wireless channel and encryption method.

Filtering Settings	Select “Allow” or “Deny” to apply IP Filtering to the traffic on the Guest Network. Provide the IP and Subnet Mask you want to apply as a filter. Up to 3 IP Filters are supported.

IV-3-3. WPS

> WPS

Wi-Fi Protected Setup is a simple way to establish connections between WPS

compatible devices. WPS can be activated on compatible devices by pushing a WPS button on the device or from within the device's firmware/configuration interface (known as PBC or "Push Button Configuration"). When WPS is activated in the correct manner and at the correct time for two compatible devices, they will automatically connect. "PIN code WPS" is a variation of PBC which includes the additional use of a PIN code between the two devices for verification.

Please refer to manufacturer's instructions for your other WPS device.

WPS	☒ Enable
-----	--

Apply

WPS	
Product PIN	58327142 Generate PIN
Push-button WPS	Start
WPS by PIN	Start

WPS Security	
WPS Status	Not Configured Release

WPS	Check/uncheck this box to enable/disable WPS functionality. WPS must be disabled when using MAC-RADIUS authentication (see IV-3-1-3-6 & IV-3-4).
Product PIN	Displays the WPS PIN code of the device, used for PIN code WPS. You will be required to enter this PIN code into another WPS device for PIN code WPS. Click “Generate PIN” to generate a new WPS PIN code.
Push-Button WPS	Click “Start” to activate WPS on the access point for approximately 2 minutes. This has the same effect as physically pushing the access point’s WPS button.
WPS by PIN	Enter the PIN code of another WPS device and click “Start” to attempt to establish a WPS connection for approximately 2 minutes.
WPS Status	WPS security status is displayed here. Click “Release” to clear the existing status.

IV-3-4. RADIUS

RADIUS

The RADIUS sub menu allows you to configure the access point's RADIUS server settings, categorized into three submenus: RADIUS settings, Internal Server and RADIUS accounts.

A RADIUS server provides user-based authentication to improve security and offer wireless client control – users can be authenticated before gaining access to a network.

The access point can utilize both a primary and secondary (backup) RADIUS server for each of its wireless frequencies (2.4GHz & 5GHz). External RADIUS servers can be used or the access point's internal RADIUS server can be used.

To use RADIUS servers, go to “Wireless Settings” → “Security” and select the desired Authentication Method → “Additional Authentication” and select “MAC RADIUS Authentication” (see IV-3-1-3. & IV-3-2-3).

The “MAC RADIUS Authentication” feature works with an external RADIUS Server Only.

IV-3-4-1. RADIUS Settings

➤ Radius Settings

Configure the RADIUS server settings for 2.4GHz & 5GHz. Each frequency can use a primary and secondary (backup) RADIUS server.

RADIUS Server (2.4GHz)	
Primary RADIUS Server	
RADIUS Type	☐ Internal ☒ External
RADIUS Server	
Authentication Port	1812
Shared Secret	
Session Timeout	3600 second(s)
Accounting	☒ Enable ☐ Disable
Accounting Port	1813
Secondary RADIUS Server	
RADIUS Type	☐ Internal ☒ External
RADIUS Server	
Authentication Port	1812
Shared Secret	
Session Timeout	3600 second(s)
Accounting	☒ Enable ☐ Disable
Accounting Port	1813

RADIUS Server (5GHz)

Primary RADIUS Server	
RADIUS Type	☐ Internal ☒ External
RADIUS Server	
Authentication Port	1812
Shared Secret	
Session Timeout	3600 second(s)
Accounting	☒ Enable ☐ Disable
Accounting Port	1813

Secondary RADIUS Server	
RADIUS Type	☐ Internal ☒ External
RADIUS Server	
Authentication Port	1812
Shared Secret	
Session Timeout	3600 second(s)
Accounting	☒ Enable ☐ Disable
Accounting Port	1813

RADIUS Type	Select “Internal” to use the access point’s built-in RADIUS server or “external” to use an external RADIUS server.
RADIUS Server	Enter the RADIUS server host IP address.
Authentication Port	Set the UDP port used in the authentication protocol of the RADIUS server. Value must be between 1 – 65535.
Shared Secret	Enter a shared secret/password between 1 – 99 characters in length. This should match the “MAC-RADIUS” password used in IV-3-1-3-6 or IV-3-2-3 .
Session Timeout	Set a duration of session timeout in seconds between 0 – 86400.
Accounting	Enable or disable RADIUS accounting.

Accounting Port

When accounting is enabled (above), set the UDP port used in the accounting protocol of the RADIUS server. Value must be between 1 – 65535.

IV-3-4-2. Internal Server

➤ Internal Server

To use the Internal Radius Server as an additional authentication, configure the “Authentication Method” in “Wireless Settings/Security” to “IEEE802.1x/EAP”. Leave “Additional Authentication” set to “No additional authentication”. Click “Apply” to save settings. (Example image below)

COMTREND WAP-EN1200C Information Network Settings Wireless Settings Management Advanced Operation Mode

Wireless Settings

- 2.4GHz 11bgn
 - Basic
 - Advanced
 - Security
 - WDS
 - Guest Network
- 5GHz 11ac 11an

RADIUS Settings

RADIUS Server (2.4GHz)

Primary RADIUS Server

RADIUS Type	☐ Internal ☒ External
RADIUS Server	
Authentication Port	1812
Shared Secret	
Session Timeout	3600 second(s)
Accounting	☒ Enable ☐ Disable
Accounting Port	1813

Secondary RADIUS Server

RADIUS Type	☐ Internal ☒ External
RADIUS Server	
Authentication Port	1812
Shared Secret	
Session Timeout	3600 second(s)
Accounting	☒ Enable ☐ Disable
Accounting Port	1813

Under “Radius/Internal Server”, check the “Enable” box next to “Internal Server”. Select “PEAP (MS-PEAP)” for “EAP Internal Authentication”. Enter numbers or characters in the field “Shared Secret”. Set “Termination-Action” option to “Reauthentication (Radius-Request).” Click “Apply” to save changes. (Example image below)

The screenshot shows the 'Internal Server' configuration window. On the left, the 'Wireless Settings' sidebar is visible with 'Internal Server' selected under 'RADIUS'. The main panel has the following fields:

- Internal Server:** ☒ Enable
- EAP Internal Authentication:** PEAP(MS-PEAP)
- EAP Certificate File Format:** PKCS#12(*.pfx/*p12)
- EAP Certificate File:** Upload
- Shared Secret:** [Empty text field]
- Session-Timeout:** 3600 second(s)
- Termination-Action:**
 - ☒ Reauthentication (RADIUS-Request)
 - ☐ Not-Reauthentication (Default)
 - ☐ Not-Send

Buttons at the bottom right: Apply, Cancel.

IV-3-4-3. RADIUS Accounts

> Radius Accounts Do the following to add Radius User Names and configure passwords. Under “Radius/Radius Accounts”, enter a “User Name” in the window and click “Add”. (Example image below)

The screenshot shows the 'RADIUS Accounts' configuration window. On the left, the 'Wireless Settings' sidebar is visible with 'RADIUS Accounts' selected under 'RADIUS'. The main panel has the following fields:

- RADIUS Accounts:**
 - User Name:** Example: USER1, USER2, USER3, USER4
 - Text Area:** paul
- Buttons:** Add, Reset
- User Registration List:**

Select	User Name	Password	Customize
No user entries			
- Buttons at the bottom right:** Delete Selected, Delete All

Select the “User Name” from the “User Registration List” and select “Edit”.
(Example image below)

The screenshot shows the 'RADIUS Accounts' configuration page. On the left is a 'Wireless Settings' sidebar with a tree view containing: 2.4GHz 11bgn (Basic, Advanced, Security, WDS), 5GHz 11ac 11an (Basic, Advanced, Security, WDS), WPS, RADIUS (RADIUS Settings, Internal Server, **RADIUS Accounts**), MAC Filter, and WMM. The main panel is titled 'RADIUS Accounts' and contains a 'User Name' input field with an example 'USER1, USER2, USER3, USER4' and a large empty text area. Below these are 'Add' and 'Reset' buttons. A 'User Registration List' table is shown below, with columns: Select, User Name, Password, and Customize. The table contains one entry for 'paul' with a checked 'Select' box and 'Not Configured' password. An 'Edit' button is in the 'Customize' column. At the bottom right are 'Delete Selected' and 'Delete All' buttons.

Select	User Name	Password	Customize
☒	paul	Not Configured	Edit

Enter a password for the selected “User”. Click “Apply” to save changes.
(Example image below)

The screenshot shows the 'Edit User Registration List' page. The sidebar is identical to the previous image. The main panel is titled 'Edit User Registration List' and contains two input fields: 'User Name' with the value 'paul' and a '(4-16 characters)' hint, and 'Password' with masked characters '*****' and a '(6-32 characters)' hint. 'Apply' and 'Cancel' buttons are at the bottom right.

Your access point is now setup to authenticate Users with the Internal Radius Server.

Wireless Client Configuration for Radius Connection on Windows 7 (Example)

Go to "Control Panel/Network and Sharing Center/Manage Wireless Network".

Click "Add" on the "Manage wireless networks thse use (Wireless Connection)" screen.

Click "Manually create a network profile".

Enter the "Network Name" which you want to connect to. The Network Name is the SSID for the Radius connection. In the examples above, the network name used is "Internal-Radius".

Adjust the "Security Type" to "802.1x". Click "Next".

Click "Change Connection Settings".

Click the "Security" tab and then "Settings".

Uncheck "Validate server certificate".

Click "Configure" next to "Secured password (EAP-MSCHAP v2)".

Uncheck "Automatically use my Windows Logon name and password".

Click "OK" to close all windows.

Select the Radius Network and Click "Connect".

You will receive a pop up message stating "Additional information is needed to conenct".

Click on the message to continue.

Enter the Username and password you created in the "Windows Security" window.

Click "OK".

Your connection to the SSID with Radius Authentication is now "Connected".

IV-3-5. MAC Filter

> **MAC Filter**

Mac filtering is a security feature that can help to prevent unauthorized users from connecting to your access point.

This function allows you to define a list of network devices permitted to connect to the access point. Devices are each identified by their unique MAC address. If a device which is not on the list of permitted MAC addresses attempts to connect to the access point, it will be denied.

To enable MAC filtering, go to “Wireless Settings” → “2.4GHz 11bgn/5GHz 11ac 11an” → “Security” → “Additional Authentication” and select “MAC Filter” (see IV-3-1-3. & IV-3-2-3).

The MAC address filtering table is displayed below:

Add MAC Addresses

Add

Reset

MAC Address Filtering Table

Select	MAC Address
☐	FC:F8:AE:43:43:7E

Delete Selected

Delete All

Export

Add MAC Address	Enter a MAC address of computer or network device manually e.g. 'aa-bb-cc-dd-ee-ff' or enter multiple MAC addresses separated with commas, e.g.
------------------------	---

	'aa-bb-cc-dd-ee-ff,aa-bb-cc-dd-ee-gg'
Add	Click "Add" to add the MAC address to the MAC address filtering table.
Reset	Clear all fields.

MAC address entries will be listed in the "MAC Address Filtering Table". Select an entry using the "Select" checkbox.

Select	Delete selected or all entries from the table.
MAC Address	The MAC address is listed here.
Delete Selected	Delete the selected MAC address from the list.
Delete All	Delete all entries from the MAC address filtering table.
Export	Click "Export" to save a copy of the MAC filtering table. A new window will pop up for you to select a location to save the file.

IV-3-6. WMM

> WMM

Wi-Fi Multimedia (WMM) is a Wi-Fi Alliance interoperability certification based on the IEEE 802.11e standard, which provides

Quality of Service (QoS) features to IEEE 802.11 networks. WMM prioritizes traffic according to four categories: background, best effort, video and voice.

WMM-EDCA Settings				
WMM Parameters of Access Point				
	CWMin	CWMax	AIFSN	TxOP
Back Ground	4	10	7	0
Best Effort	4	6	3	0
Video	3	4	1	94
Voice	2	3	1	47

WMM Parameters of Station				
	CWMin	CWMax	AIFSN	TxOP
Back Ground	4	10	7	0
Best Effort	4	10	3	0
Video	3	4	2	94
Voice	2	3	2	47

Configuring WMM consists of adjusting parameters on queues for different categories of wireless traffic. Traffic is sent to the following queues:

Background	Low Priority	High throughput, non time sensitive bulk data e.g. FTP
Best Effort	Medium Priority	Traditional IP data, medium throughput and delay.
Video	High Priority	Time sensitive video data with minimum time delay.
Voice	High Priority	Time sensitive data such as VoIP and streaming media with minimum time delay.

Queues automatically provide minimum transmission delays for video, voice, multimedia and critical applications. The values can further be adjusted manually:

CWMin	Minimum Contention Window (milliseconds): This value is input to the initial random backoff wait time algorithm for retry of a data frame transmission. The backoff wait time will be generated between 0 and this value. If the frame is not sent, the random backoff value is doubled until the value reaches the number defined by CWMax (below). The CWMin value must be lower than the CWMax value. The contention window scheme helps to avoid frame collisions and determine priority of frame transmission. A shorter window has a higher probability (priority) of transmission.
CWMax	Maximum Contention Window (milliseconds): This value is the upper limit to random backoff value doubling (see above).
AIFSN	Arbitration Inter-Frame Space (milliseconds): Specifies additional time between when a channel goes idle and the AP/client sends data frames. Traffic with a lower AIFSN value has a higher priority.
TxOP	Transmission Opportunity (milliseconds): The maximum interval of time an AP/client can transmit. This makes channel access more efficiently prioritized. A value of 0 means only one frame per transmission. A greater value effects higher priority.

IV-3-7. Traffic Shaping

Traffic Shaping allows an administrator to limit the bandwidth available to each SSID. Providing a value between 0-1024Mbps. A value of “0” indicates unlimited bandwidth.

The screenshot displays the 'Wireless Settings' window on the left and the 'Traffic Shaping' configuration window on the right. The 'Traffic Shaping' window is titled 'Traffic Shaping for ssid(2.4GHz)' and includes an 'Enable' checkbox, a 'Down Link/Up Link Maximum' field set to '1024 Mbps', and a table for configuring bandwidth limits for various SSIDs.

SSID	Down Link	Up Link
WAP-EN1750W-07DEA0_G_1	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_2	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_3	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_4	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_5	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_6	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_7	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_8	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_9	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_10	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_11	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_12	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_13	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_14	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_15	0 Mbps	0 Mbps
WAP-EN1750W-07DEA0_G_16	0 Mbps	0 Mbps

IV-4. Management

Screenshots displayed are examples. The information shown on your screen will vary depending on your configuration.

IV-4-1. Admin

You can change the password used to login to the browser-based configuration interface here. It is advised to do so for security purposes.

If you change the administrator password, please make a note of the new password. In the event that you forget this password and are unable to login to the browser based configuration interface, see I-5. Reset for how to reset the access point.

Account to Manage This Device	
Administrator Name	Set the access point's administrator name. This is used to log in to the browser based configuration interface and must be between 4-16 alphanumeric characters (case sensitive).
Administrator Password	Set the access point's administrator password. This is used to log in to the browser based configuration interface and must be between 4-32 alphanumeric characters (case sensitive).

Advanced Settings	
Product Name	Edit the product name according to your preference consisting of 1-32 alphanumeric characters. This name is used for reference purposes.

Management Protocol	Check/uncheck the boxes to enable/disable specified management interfaces (see below). When SNMP is enabled, complete the SNMP fields below.
SNMP Version	Select SNMP version appropriate for your SNMP manager.
SNMP Get Community	Enter an SNMP Get Community name for verification with the SNMP manager for SNMP-GET requests.
SNMP Set Community	Enter an SNMP Set Community name for verification with the SNMP manager for SNMP-SET requests.
SNMP Trap	Enable or disable SNMP Trap to notify SNMP manager of network errors.
SNMP Trap Community	Enter an SNMP Trap Community name for verification with the SNMP manager for SNMP-TRAP requests.
SNMP Trap Manager	Specify the IP address or sever name (2-128 alphanumeric characters) of the SNMP manager.

HTTP

Internet browser HTTP protocol management interface

HTTPS

Internet browser HTTPS protocol management interface

TELNET

Client terminal with telnet protocol management interface

SSH

Client terminal with SSH protocol version 1 or 2 management interface

SNMP

Simple Network Management Protocol. SNMPv1, v2 & v3 protocol supported. SNMPv2 can be used with community based authentication. SNMPv3 uses user-based security model (USM) architecture.

IV-4-2. Date and Time

> Date and Time

You can configure the time zone settings of your access point here. The date and time of the device can be configured manually or can be synchronized with a time server.

Date and Time Settings	
Local Time	2012 ▾ Year Jan ▾ Month 1 ▾ Day
	0 ▾ Hours 00 ▾ Minutes 00 ▾ Seconds
Acquire Current Time from Your PC	

NTP Time Server	
Use NTP	☐ Enable

Update Interval	24 (Hours)

Time Zone	
Time Zone	(GMT) Greenwich Mean Time: Dublin, Edinburgh, Lisbon, London ▾

Date and Time Settings	
Local Time	Set the access point's date and time manually using the drop down menus.
Acquire Current Time from your PC	Click "Acquire Current Time from Your PC" to enter the required values automatically according to your computer's current time and date.

NTP Time Server	
Use NTP	The access point also supports NTP (Network Time Protocol) for automatic time and date

	setup.
Server Name	Enter the host name or IP address of the time server if you wish.
Update Interval	Specify a frequency (in hours) for the access point to update/synchronize with the NTP server.

Time Zone	
Time Zone	Select the time zone of your country/ region. If your country/region is not listed, please select another country/region whose time zone is the same as yours.

IV-4-3. Syslog Server

> Syslog Server

The system log can be sent to a server.

Syslog Server Settings

Transfer Logs

☐ Enable Syslog Server

Transfer Logs	Check/uncheck the box to enable/disable the use of a syslog server, and enter a host name, domain or IP address for the server, consisting of up to 128 alphanumeric characters.
---------------	--

IV-4-4. I'm Here

> I'm Here

The access point features a built-in buzzer which can sound on command using the “I’m Here” page. This is useful for network administrators and engineers working in complex network environments to locate the access point.

Duration of Sound

Duration of Sound 10 (1-300 seconds)

Sound Buzzer

The buzzer is loud!

Duration of Sound	Set the duration for which the buzzer will sound when the “Sound Buzzer” button is clicked.
Sound Buzzer	Activate the buzzer sound for the above specified duration of time.

IV-4-5. TR-069

TR-069 allows an administrator to connect the wireless access point to a remote ACS system. Please provide the destination and login credentials to the ACS system.

Management

☐ Open file with password.

Restore

Save / Restore Settings	
Using Device	Select “Using your PC” to save the access point’s settings to your local computer.
Save Settings to PC	
Save Settings	Click “Save” to save settings and a new window will open to specify a location to save the settings file. You can also check the “Encrypt the configuration file with a password” box and enter a password to protect the file in the field underneath, if you wish.

Restore Settings from PC	
Restore Settings	Click the browse button to find a previously saved settings file on your computer, then click “Restore” to replace your current settings. If your settings file is encrypted with a password, check the “Open file with password” box and enter the password in the field underneath.

IV-5-4. Factory Default

> Factory Default

If the access point malfunctions or is not responding, then it is recommended that you reboot the device (see **IV-5.5**) or reset the device back to its factory default settings. You can reset the access point back to its default settings using this feature if the location of the access point is not convenient to access the reset button.

This will restore all settings to factory defaults.

Factory Default

Factory Default

Click “Factory Default” to restore settings to the factory default. A pop-up window will appear and ask you to confirm.

After resetting to factory defaults, please wait for the access point to reset and restart.

IV-5-5. Reboot

> Reboot

If the access point malfunctions or is not responding, then it is recommended that you reboot the device or reset the access point back to its factory default settings (see **IV-5-4**). You can reboot the access point remotely using this feature.

This will reboot the product. Your settings will not be changed. Click "Reboot" to reboot the product now.

Reboot

Reboot	Click "Reboot" to reboot the device. A countdown will indicate the progress of the reboot.
--------	--

V. Appendix

V-1. Configuring your IP address

If no DHCP Service is detected, the access point uses the default IP address **192.168.2.1**. In order to access the browser based configuration interface, you need to modify the IP address of your computer to be in the same IP address subnet e.g. **192.168.2.x (x = 3 – 254)**.

The procedure for modifying your IP address varies across different operating systems; please follow the guide appropriate for your operating system.

In the following examples we use the IP address **192.168.2.10** though you can use any IP address in the range **192.168.2.x (x = 3 – 254)**.

V-1-1. Windows XP

1. Click the “Start” button (it should be located in the lower-left corner of your computer), then click “Control Panel”. Double-click the “Network and Internet Connections” icon, click “Network Connections”, and then double-click “Local Area Connection”. The “Local Area Connection Status” window will then appear, click “Properties”.

2. Select “Use the following IP address”, then input the following values:

IP address: 192.168.2.10

Subnet Mask: 255.255.255.0

Click ‘OK’ when finished.

V-1-2. Windows Vista

1. Click the “Start” button (it should be located in the lower-left corner of your computer), then click “Control Panel”. Click “View Network Status and Tasks”, then click “Manage Network Connections”. Right-click “Local Area Network”, then select “Properties”. The “Local Area Connection Properties” window will then appear, select “Internet Protocol Version 4 (TCP / IPv4)”, and then click “Properties”.

2. Select “Use the following IP address”, then input the following values:

IP address: 192.168.2.10

Subnet Mask: 255.255.255.0

Click ‘OK’ when finished.

V-1-3. Windows 7

1. Click the “Start” button (it should be located in the lower-left corner of your computer), then click “Control Panel”.

2. Under “Network and Internet” click “View network status and tasks”.

3. Click “Local Area Connection”.

4. Click “Properties”.

5. Select “Internet Protocol Version 4 (TCP/IPv4)” and then click “Properties”.

6. Select “Use the following IP address”, then input the following values:

IP address: 192.168.2.10

Subnet Mask: 255.255.255.0

Click ‘OK’ when finished.

V-1-4. Windows 8

1. From the Windows 8 Start screen, you need to switch to desktop mode. Move your cursor to the bottom left of the screen and click.

2. In desktop mode, click the File Explorer icon in the bottom left of the screen, as shown below.

3. Right click “Network” and then select “Properties”.

4. In the window that opens, select “Change adapter settings” from the left side.

5. Choose your connection and right click, then select “Properties”.

6. Select “Internet Protocol Version 4 (TCP/IPv4)” and then click “Properties”.

7. Select “Use the following IP address”, then input the following values:

IP address: 192.168.2.10

Subnet Mask: 255.255.255.0

Click 'OK' when finished.

V-1-5. Mac

1. Have your Macintosh computer operate as usual, and click on “System Preferences”

2. In System Preferences, click on “Network”.

3. Click on “Ethernet” in the left panel.

4. Open the drop-down menu labeled “Configure IPv4” and select “Manually”.

5. Enter the IP address 192.168.2.10 and subnet mask 255.255.255.0. Click on “Apply” to save the changes.

V-1-6. Glossary

Default Gateway (Access point): Every non-access point IP device needs to configure a default gateway's IP address. When the device sends out an IP packet, if the destination is not on the same network, the device has to send the packet to its default gateway, which will then send it out towards the destination.

DHCP: Dynamic Host Configuration Protocol. This protocol automatically gives every computer on your home network an IP address.

DNS Server IP Address: DNS stands for Domain Name System, which allows Internet servers to have a domain name (such as `www.Broadbandaccess point.com`) and one or more IP addresses (such as `192.34.45.8`). A DNS server keeps a database of Internet servers and their respective domain names and IP addresses, so that when a domain name is requested (as in typing "`Broadbandaccess point.com`" into your Internet browser), the user is sent to the proper IP address. The DNS server IP address used by the computers on your home network is the location of the DNS server your ISP has assigned to you.

DSL Modem: DSL stands for Digital Subscriber Line. A DSL modem uses your existing phone lines to transmit data at high speeds.

Ethernet: A standard for computer networks. Ethernet networks are connected by special cables and hubs, and move data around at up to 10/100 million bits per second (Mbps).

IP Address and Network (Subnet) Mask: IP stands for Internet Protocol. An IP address consists of a series of four numbers separated by periods, that identifies a single, unique Internet computer host in an IP network. Example: `192.168.2.1`. It consists of 2 portions: the IP network address, and the host identifier.

The IP address is a 32-bit binary pattern, which can be represented as four cascaded decimal numbers separated by ".": `aaa.aaa.aaa.aaa`, where each "aaa" can be anything from 000 to 255, or as four cascaded binary numbers separated by ".": `bbbbbbbbb.bbbbbbbbbb.bbbbbbbbbb.bbbbbbbbbb`, where each "b" can either be 0 or 1.

A network mask is also a 32-bit binary pattern, and consists of consecutive leading 1's followed by consecutive trailing 0's, such as 11111111.11111111.11111111.00000000. Therefore sometimes a network mask can also be described simply as "x" number of leading 1's. When both are represented side by side in their binary forms, all bits in the IP address that correspond to 1's in the network mask become part of the IP network address, and the remaining bits correspond to the host ID.

For example, if the IP address for a device is, in its binary form, 11011001.10110000.10010000.00000111, and if its network mask is, 11111111.11111111.11110000.00000000 It means the device's network address is 11011001.10110000.10010000.00000000, and its host ID is, 00000000.00000000.00000000.00000111. This is a convenient and efficient method for access points to route IP packets to their destination.

ISP Gateway Address: (see ISP for definition). The ISP Gateway Address is an IP address for the Internet access point located at the ISP's office.

ISP: Internet Service Provider. An ISP is a business that provides connectivity to the Internet for individuals and other businesses or organizations.

LAN: Local Area Network. A LAN is a group of computers and devices connected together in a relatively small area (such as a house or an office). Your home network is considered a LAN.

MAC Address: MAC stands for Media Access Control. A MAC address is the hardware address of a device connected to a network. The MAC address is a unique identifier for a device with an Ethernet interface. It is comprised of two parts: 3 bytes of data that corresponds to the Manufacturer ID (unique for each manufacturer), plus 3 bytes that are often used as the product's serial number.

NAT: Network Address Translation. This process allows all of the computers on your home network to use one IP address. Using the broadband access point's NAT capability, you can access the Internet from any computer on your home network without having to purchase more IP addresses from your ISP.

Port: Network Clients (LAN PC) uses port numbers to distinguish one network application/protocol over another. Below is a list of common applications and protocol/port numbers:

Application	Protocol	Port Number
Telnet	TCP	23
FTP	TCP	21
SMTP	TCP	25
POP3	TCP	110
H.323	TCP	1720
SNMP	UCP	161
SNMP Trap	UDP	162
HTTP	TCP	80
PPTP	TCP	1723
PC Anywhere	TCP	5631
PC Anywhere	UDP	5632

Access point: A access point is an intelligent network device that forwards packets between different networks based on network layer address information such as IP addresses.

Subnet Mask: A subnet mask, which may be a part of the TCP/IP information provided by your ISP, is a set of four numbers (e.g. 255.255.255.0) configured like an IP address. It is used to create IP address numbers used only within a particular network (as opposed to valid IP address numbers recognized by the Internet, which must be assigned by InterNIC).

TCP/IP, UDP: Transmission Control Protocol/Internet Protocol (TCP/IP) and Unreliable Datagram Protocol (UDP). TCP/IP is the standard protocol for data transmission over the Internet. Both TCP and UDP are transport layer protocol. TCP performs proper error detection and error recovery, and thus is reliable. UDP on the other hand is not reliable. They both run on top of the IP (Internet Protocol), a network layer protocol.

WAN: Wide Area Network. A network that connects computers located in geographically separate areas (e.g. different buildings, cities, countries). The Internet is a wide area network.

Web-based management Graphical User Interface (GUI): Many devices support a graphical user interface that is based on the web browser. This means the user can use the familiar Netscape or Microsoft Internet Explorer to Control/configure or monitor the device being managed.

V-2. Hardware Specification

MCU/RF	MediaTek MT7620A(2.4GHz) + QCA9882(5GHz)
PHY/Switch	Qualcomm Atheros AR8035
Memory	DDR2 64MB
Flash	8MB
Physical Interface	-LAN: 10/100/1000 Gigabit Ethernet with PoE support 802.3af (PD In) -Reset Button -DC Power Jack
Power Requirement	Power over Ethernet, IEEE 802.3af DC : 12V / 1A
Antenna	Internal PIFA Antenna (3dBi 2.4GHz x 2, 4dBi 5GHz x 2)
Others	Internal Buzzer (Find me)

V-3. Environment & Physical

Temperature Range	Operation : 0 to 40°C (32°F to 104°F) Storage : -20 to 60°C (-4°F to 140°F)
Humidity	90% or less – Operating, 90% or less - Storage
Certifications	FCC, CE
Dimensions	6.9(D) x 1.2(H) inches
Weight	10.8 oz.

Federal Communication Commission Interference Statement

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

1. Reorient or relocate the receiving antenna.
2. Increase the separation between the equipment and receiver.
3. Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
4. Consult the dealer or an experienced radio technician for help.

FCC Caution

This device and its antenna must not be co-located or operating in conjunction with any other antenna or transmitter. This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation. Any changes or modifications not expressly approved by the party responsible for compliance could void the authority to operate equipment.

FCC Radiation Exposure Statement:

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

R&TTE Compliance Statement

This equipment complies with all the requirements of DIRECTIVE 1999/5/EC OF THE EUROPEAN PARLIAMENT AND THE COUNCIL of March 9, 1999 on radio equipment and telecommunication terminal equipment and the mutual recognition of their conformity (R&TTE). The R&TTE Directive repeals and replaces in the directive 98/13/EEC (Telecommunications Terminal Equipment and Satellite Earth Station Equipment) As of April 8, 2000.

Safety

This equipment is designed with the utmost care for the safety of those who install and use it. However, special attention must be paid to the dangers of electric shock and static electricity when working with electrical equipment. All guidelines of this and of the computer manufacture must therefore be allowed at all times to ensure the safe use of the equipment.

EU Countries Intended for Use

The ETSI version of this device is intended for home and office use in Austria, Belgium, Bulgaria, Cyprus, Czech, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, Turkey, and United Kingdom. The ETSI version of this device is also authorized for use in EFTA member states: Iceland, Liechtenstein, Norway, and Switzerland.

EU Countries Not Intended for Use

None
